

From Rankings to *Revenue*

Building growth systems that turn search demand into compounding business value, through -

- Technical SEO
- Enterprise SEO
- Organic Growth
- AI Search
- Demand Generation

6+ years experience across startups, agencies, and enterprise. I don't just "get pages to rank", I build systems that drive growth.

NUMBERS MATTER

But I've always found the story behind them more interesting than the metrics themselves. Across startups and enterprise environments, the objective stayed the same: Build systems that create sustainable growth.

"What stuck with me: Growth becomes more interesting when it compounds."

PROBLEMS I ENJOY SOLVING

Complexity is where the real growth levers are hidden. Different environments create different kinds of SEO challenges:

STARTUPS

Speed & Experimentation. Rapid iteration, lean frameworks, and finding initial organic traction quickly.

ENTERPRISE

Complexity through Scale. Coordinating structural multi-brand governance, cross-team legacy infrastructure, and international operations.

AGENCIES

Adaptability. Managing diverse multi-industry client expectations and aligning immediate deliverables with cross-functional constraints.

PRODUCTS

Ownership. End-to-end alignment from product launch phases, integrating growth hooks directly into core platform features.

CASE STUDY 1 — SUPERSOURCING

When More Traffic Wasn't the Answer

The Problem Narrative: One of the more interesting challenges I worked on involved a site that looked healthy from the outside. Traffic was growing. Visibility was growing. But pipeline wasn't. Instead of asking 'How do we grow traffic?', the better question became: **'Are we attracting the right people?'**

Startup Context: Hirium

I was also part of an environment where growth and product often overlapped. During this period, I supported SEO and growth initiatives around Hirium while the ATS platform was still being built and launched.

Tactical Execution:

- Rebuilt targeting around ICP intent
- Developed content clusters
- Improved internal linking
- Collaborated on UX and landing pages
- Introduced MQL-focused reporting
- Implemented CRO elements

"What stuck with me: Traffic is a metric. Intent creates outcomes."

CASE STUDY 2 — IMPELLAM GROUP

Enterprise SEO Taught Me That Scale Changes Everything

Enterprise SEO introduced me to a different kind of complexity. The issue wasn't ideas. The issue was coordination. Multiple brands. Multiple stakeholders. Different priorities. Different reporting systems.

Core Focus Areas

01. CENTRALIZED GOVERNANCE

Establishing unified SEO standards, quality benchmarks, and operational guidelines across all separate business units.

04. CONTENT FRAMEWORKS

Developing scalable intent-matching blueprints and topical cluster strategies to capture targeted search demand.

02. REPORTING SYSTEMS

Building automated, consistent performance dashboards that provide clear insight into cross-channel organic health.

05. MIGRATION PLANNING

Executing high-stakes domain consolidations, redirect mappings, and CMS transitions completely risk-free without losing historical traffic.

03. TECHNICAL FOUNDATIONS

Designing and optimizing critical crawl infrastructure, site speed metrics, and clean rendering architecture for millions of pages.

06. CROSS-TEAM ALIGNMENT

Bridging structural communication gaps between Product, Engineering, and Content teams to turn technical SEO tickets into shipped features.

OUTCOMES

- **61% Search visibility growth across brands**
- Improved reporting consistency
- Clearer attribution through tracking governance
- Stronger scalability

"What stuck with me: Enterprise SEO maturity often depends more on systems than tactics."

MY CURRENT PROJECT — FLAGSHIP ENGAGEMENT AT IMPELLAM

The Biggest SEO Project I've Led So Far

Consolidating 12 Brands Into One Ecosystem

Project Context: This project involved domain migration, CMS changes, redesigns, subdomain consolidation, URL restructuring, and phased brand sunsets across 12 brands and multiple regions. The challenge wasn't simply protecting rankings. It was protecting years of accumulated visibility while coordinating a project with many moving parts.

Migration Framework:

Owned End-To-End:

- Migration audits
- Architecture planning
- Redirect strategy
- QA systems
- Page valuation frameworks
- Content consolidation logic
- Phased rollout planning

THE NEXT FRONTIER — SEARCH BEYOND SERPS

"Search behavior feels increasingly different from even a few years ago. Questions are becoming conversations. Users move between search engines, AI assistants, and zero-click experiences. The interesting question isn't whether AI changes SEO. The question is: What happens when discoverability becomes larger than search itself?"

AREAS I'M CURRENTLY EXPLORING

- AI-readable content structures
- Scalable content frameworks
- Entity optimization
- Answer-engine visibility
- Conversational search
- AI-assisted workflows

EVOLUTION — THINGS I'VE CHANGED MY MIND ABOUT

Experience quietly changes assumptions. A few things I think differently about today:

01. Traffic Growth

I used to think more traffic was always better. Now I know that 100 targeted visitors are worth more than 10,000 "info-seekers" who will never convert.

"Acquisition quality matters as much as volume."

02. SEO Problems

SEO problems often aren't SEO problems. I used to see SEO as a siloed set of tasks. Now I see them as business problems, revenue leaks, user friction, and brand visibility gaps.

"Many eventually turn out to be reporting, ownership, or process issues."

03. Internal Linking

I used to treat internal links as a crawl efficiency play. Now I see them as a high-leverage product feature that defines the user's journey through our knowledge base.

"Over time I stopped seeing it as a checklist task and started treating it like a growth lever."

04. Broad Search

Search is becoming broader than search engines. I used to focus solely on the SERP. Now I look at the entire ecosystem (Reddit, YouTube, AI overviews) and ask where the conversation is happening.

"Visibility increasingly happens outside traditional SERPs."

THINGS I'VE LEARNED, NOTICED & OCCASIONALLY POSTED ABOUT

Most ideas don't start with trends. They start with something feeling slightly off.

Insight 01

"Paying Attention Is a Skill - A tiny mismatch between GA and GSC became a reminder that small inconsistencies often completely change how data gets interpreted."

What Stuck: Good analysis usually begins with curiosity.

Insight 02

"Traffic Means Very Little Without Intent - One of the biggest wins in my career started by removing large parts of a website and rebuilding around ICP intent."

What Stuck: Traffic is a metric. Intent creates outcomes.

Insight 03

"SEO Taught Me Patience - SEO often requires defending strategy before results appear."

What Stuck: Patience isn't passive—it often means educating and holding your ground.

Insight 04

"Learning by Doing Changed Everything - I never planned on finding SEO. Experimentation eventually pulled me in."

What Stuck: Most meaningful learning happened after things broke.

TECHNICAL SEO THINGS I ENJOY SOLVING

Some people enjoy content. Some love link building. I've always enjoyed technical SEO because it feels like systems, problem-solving, and detective work combined.

Areas I regularly work across:

Crawl & Indexation

Internal Linking Systems

Migration SEO

Core Web Vitals

Site Architecture

Content Pruning

MY SEO OPERATING SYSTEM

A repeatable framework for finding, executing, and scaling organic growth opportunities.

BEHIND THE WORKFLOW

Looker / GA4 Dashboards

Migration Plans

Internal Link Maps

Redirect Frameworks

Technical Audits

Content Clusters

HOW I THINK ABOUT SEO

SEO stopped feeling like an isolated channel once I saw how many things influence growth. I think of SEO as a compounding system where improvements across multiple layers create long-term impact.

Top Layer: Product & UX

Conversion and retention flow

Growth Layer: Content & Demand

Intent matching and cluster building

Foundation: Technical Health

Crawlability, Speed, and Infrastructure

Professional Profile & Philosophy

"Still curious. Still experimenting. And still oddly excited by difficult SEO problems."

I've always enjoyed environments where things are still being figured out. Maybe that's why my experience naturally moved across startups, agencies, enterprise environments, and product launches. I enjoy solving messy problems, building systems, and working on projects where there isn't an obvious answer. Lately I've become especially interested in AI discoverability, changing search behavior, and understanding what the next version of SEO might look like.
